### Sandbox Analysis Summary

Sandbox analysis are grouped by programmer. A README.txt file is in each file explaining what to look out for. There may be scripts in a folder with comments in the header as to how the attack works to bring about a bugs or exploit. If the script does not have any comments, the comments will be in the README.txt instead.

In general, sandboxes in the assessed group had either syntax errors or had very restricted namespaces for program execution (in which a blacklist and/or whitelist was used).
