https://github.com/WilsonLiCode/SecureTuringCompleteSandbox

Sandbox uses a blacklist of keywords (which can be found in the keyword python module) to test against program. A whilelist was used to define the global space in which the program will be executed in.

Bug:

Syntax error was found when checking the type of file passed in. Refer to the following lines of code:

```
try:

    if !sys.argv[1].endswith(".py"):

        print "Sandbox only supports .py files"

        exit(1)
```

"!" is incorrectly used.
